**Abstract:** The aim of this paper is to introduce and study the concepts of contra  $\alpha g$ -open and almost contra  $\alpha g$ -open mappings and the interrelationship between other contra-open maps.

**Keywords:**  $\alpha g$ -open set,  $\alpha g$ -open map,  $\alpha g$ -closed map, contra-closed map, contra  $\alpha$ -open map, contra  $\alpha$ -closed map, contra  $\alpha g$ -open map and almost contra  $\alpha g$ -open map.

**AMS Classification:** 54C10, 54C08, 54C05

### §1. INTRODUCTION:

Mappings plays an important role in the study of modern mathematics, especially in Topology and Functional analysis. Open mappings are one such which are studied for different types of open sets by various mathematicians for the past many years. N.Biswas, discussed about semiopen mappings in the year 1969, A.S.Mashhour, M.E.Abd El-Monsef and S.N.El-Deeb studied preopen mappings in the year 1982 and S.N.El-Deeb, and I.A.Hasanien defined and studied about preclosed mappings in the year 1983. Further Asit kumar sen and P. Bhattacharya discussed about pre-closed mappings in the year 1993. A.S.Mashhour, I.A.Hasanein and S.N.El-Deeb introduced  $\alpha$ -open and  $\alpha$ -closed mappings in the year 1982, F.Cammaroto and T.Noiri discussed about semipre-open and semipre-closed mappings in the year 1989 and G.B.Navalagi further verified few results about semipreclosed mappings. M.E.Abd El-Monsef, S.N.El-Deeb and R.A.Mahmoud introduced  $\beta$ -open mappings in the year 1983. C. W. Baker, introduced Contra-open functions and contra-closed functions in the year 1997. M.Caldas and C.W.Baker introduced contra pre-semiopen Maps in the year 2000. During the years 2010 to 2014, S. Balasubramanian together with his research scholars defined and studied a variety of open, closed, almost open and almost closed mappings for  $\nu$ -open,  $rp$ -open  $gpr$ -closed and  $vg$ -closed sets as well contra-open and contra-closed mappings for semi-open, pre-open,  $rp$ -open,  $\beta$ -open and  $gpr$ -closed sets. Inspired with these concepts and its interesting properties the authors of this paper tried to study a new variety of open maps called contra  $\alpha g$ -open and almost contra  $\alpha g$ -open maps. Throughout the paper  $X, Y$  means topological spaces  $(X, \tau)$  and  $(Y, \sigma)$  on which no separation axioms are assured.

### §2. Preliminaries:

**Definition 2.1:**  $A \subseteq X$  is said to be

- regular open [ $\alpha$ -open] if  $A = \text{int}(\text{cl}(A))$  [ $A \subseteq \text{int}(\text{cl}(\text{int}(A)))$ ] and regular closed [ $\alpha$ -closed] if  $A = \text{cl}(\text{int}(A))$  [ $\text{cl}(\text{int}(\text{cl}(A))) \subseteq A$ ]
- $g$ -closed [ $rg$ -closed,  $\alpha g$ -closed] if  $\text{cl}(A) \subset U$  [ $r\text{cl}(A) \subset U$ ,  $\alpha\text{-cl}(A) \subset U$ ] whenever  $A \subset U$  and  $U$  is open [ $r$ -open,  $\alpha$ -open] in  $X$  and  $g$ -open [ $rg$ -open,  $\alpha g$ -open] if its complement  $X - A$  is  $g$ -closed [ $rg$ -closed,  $\alpha g$ -closed].

**Remark 1:** We have the following implication diagrams for closed sets.

- |                    |                   |   |
|--------------------|-------------------|---|
| $rg\text{-closed}$ | $g\text{-closed}$ |   |
| $\uparrow$         | $\downarrow$      |   |
| $r\text{-closed}$  |                   | $\alpha\text{-closed} \rightarrow \alpha g\text{-closed}$ |

$r\text{-closed} \rightarrow \text{closed} \rightarrow \alpha\text{-closed} \rightarrow \alpha g\text{-closed}$

None is reversible

The same relation is true for open sets also.

**Definition 2.2:** A function  $f: X \rightarrow Y$  is said to be

- continuous [resp:  $r$ -continuous,  $\alpha$ -continuous] if the inverse image of every open set is open [resp:  $r$ -open,  $\alpha$ -open].
- $r$ -irresolute [resp:  $\alpha$ -irresolute] if the inverse image of every  $r$ -open [resp:  $\alpha$ -open] set is  $r$ -open [resp:  $\alpha$ -open].
- closed [resp:  $r$ -closed,  $\alpha$ -closed] if the image of every closed set is closed [resp:  $r$ -closed,  $\alpha$ -closed].
- $g$ -continuous [resp:  $rg$ -continuous,  $\alpha g$ -continuous] if the inverse image of every closed set is  $g$ -closed. [resp:  $rg$ -closed,  $\alpha g$ -closed].

**Definition 2.3:** A function  $f: X \rightarrow Y$  is said to be

- contra closed [resp: contra  $\alpha$ -closed; contra  $r\alpha$ -closed; contra  $r$ -closed; contra  $g$ -closed] if the image of every closed set in  $X$  is open [resp:  $\alpha$ -open;  $r\alpha$ -open;  $r$ -open;  $g$ -open] in  $Y$ .
- contra open [resp: contra  $\alpha$ -open; contra  $r\alpha$ -open; contra  $r$ -open; contra  $g$ -open] if the image of every open set in  $X$  is closed [resp:  $\alpha$ -closed;  $r\alpha$ -closed;  $r$ -closed;  $g$ -closed] in  $Y$ .
- almost contra closed [resp: almost contra  $\alpha$ -closed; almost contra  $r\alpha$ -closed; almost contra  $r$ -closed; almost contra  $g$ -closed] if the image of every closed set in  $X$  is open [resp:  $\alpha$ -open;  $r\alpha$ -open;  $r$ -open;  $g$ -open] in  $Y$ .
- almost contra open [resp: almost contra  $\alpha$ -open; almost contra  $r\alpha$ -open; almost contra  $r$ -open; almost contra  $g$ -open] if the image of every open set in  $X$  is closed [resp:  $\alpha$ -closed;  $r\alpha$ -closed;  $r$ -closed;  $g$ -closed] in  $Y$ .

**Definition 2.4:**  $X$  is said to be  $T_{1/2}[r-T_{1/2}]$  if every (regular) generalized closed set is (regular) closed.

### §3. CONTRA $\alpha g$ -OPEN MAPPINGS:

**Definition 3.1:** A function  $f: X \rightarrow Y$  is said to be contra  $\alpha g$ -open if the image of every open set in  $X$  is  $\alpha g$ -closed in  $Y$ .

**Theorem 3.1:** We have the following interrelation among the following contra open mappings

- (i)
- |   |              |                    |
|---|--------------|--------------------|
| $c.r\alpha.open$  | $c.g.open$   |                    |
| $\uparrow$  | $\downarrow$ |                    |
| $c.r.open \rightarrow c.open \rightarrow c.\alpha.open \rightarrow c.\alpha g.open$ |              | None is reversible |

- (ii) If  $\alpha GC(Y) = RC(Y)$ , then the reverse relations hold for all almost contra open maps.

$c.r\alpha.open$	$c.g.open$
$\uparrow \downarrow$	$\uparrow \downarrow$
$c.r.open \leftrightarrow c.open \leftrightarrow c.\alpha.open \leftrightarrow c.\alpha g.open$	

**Example 1:** Let  $X = Y = \{a, b, c\}$ ;  $\tau = \{\emptyset, \{a\}, \{b, c\}, X\} = \sigma$ . Let  $f: X \rightarrow Y$  be defined  $f(a) = c, f(b) = a$  and  $f(c) = b$ . Then  $f$  is contra  $\alpha g$ -open.

**Example 2:** Let  $X = Y = \{a, b, c\}$ ;  $\tau = \{\emptyset, \{a\}, \{b, c\}, X\}$ ;  $\sigma = \{\emptyset, \{a\}, \{b\}, \{a, b\}, Y\}$ . Let  $f: X \rightarrow Y$  be defined  $f(a) = c, f(b) = a$  and  $f(c) = b$ . Then  $f$  is not contra  $\alpha g$ -open, contra open, contra  $\alpha$ -open, contra  $r\alpha$ -open and contra  $g$ -open.

**Theorem 3.2:**

- (i) If  $(Y, \sigma)$  is discrete, then  $f$  is contra open of all types.

- (ii) If  $f$  is contra open and  $g$  is  $\alpha g$ -closed then  $gof$  is contra  $\alpha g$ -open.
- (iii) If  $f$  is open and  $g$  is contra  $\alpha g$ -open then  $gof$  is contra  $\alpha g$ -open.

**Corollary 3.1:** If  $f$  is contra open and  $g$  is  $[r-; \alpha-; r\alpha-; g-]$  closed then  $gof$  is contra  $\alpha g$ -open.

**Corollary 3.2:** If  $f$  is open  $[r$ -open] and  $g$  is  $c$ - $[c-r-; c-\alpha-; c-r\alpha-]$  open then  $gof$  is contra  $\alpha g$ -open.

**Theorem 3.3:** If  $f: X \rightarrow Y$  is contra  $\alpha g$ -open, then  $\alpha g(\text{cl}(f(A))) \subset f(\text{cl}(A))$

**Proof:** Let  $A \subset X$  be open and  $f: X \rightarrow Y$  is contra  $\alpha g$ -open gives  $f(\text{cl}\{A\})$  is  $\alpha g$ -closed in  $Y$  and  $f(A) \subset f(\text{cl}(A))$  which in turn gives  $\alpha g(\text{cl}(f(A))) \subset \alpha g(\text{cl}(f(\text{cl}(A))))$ ----- (1)

Since  $f(\text{cl}(A))$  is  $\alpha g$ -closed in  $Y$ ,  $\alpha g(\text{cl}(f(\text{cl}(A)))) = f(\text{cl}(A))$ ----- (2)

From (1) and (2) we have  $\alpha g(\text{cl}(f(A))) \subset f(\text{cl}(A))$  for every subset  $A$  of  $X$ .

**Remark 2:** Converse is not true in general.

**Corollary 3.3:** If  $f: X \rightarrow Y$  is  $c$ - $[c-r-; c-\alpha-; c-r\alpha-]$  open, then  $\alpha g(\text{cl}(f(A))) \subset f(\text{cl}(A))$

**Theorem 3.4:** If  $f: X \rightarrow Y$  is contra  $\alpha g$ -open and  $A \subseteq X$  is open,  $f(A)$  is  $\tau_{\alpha g}$ -closed in  $Y$ .

**Proof:** Let  $A \subset X$  be open and  $f: X \rightarrow Y$  is contra  $\alpha g$ -open implies  $\alpha g(\text{cl}(f(A))) \subset f(\text{cl}(A))$  which in turn implies  $\alpha g(\text{cl}(f(A))) \subset f(A)$ , since  $f(A) = f(\text{cl}(A))$ . But  $f(A) \subset \alpha g(\text{cl}(f(A)))$ . Combining we get  $f(A) = \alpha g(\text{cl}(f(A)))$ . Hence  $f(A)$  is  $\tau_{\alpha g}$ -closed in  $Y$ .

**Corollary 3.4:** If  $f: X \rightarrow Y$  is  $c$ - $[c-r-; c-\alpha-; c-r\alpha-]$  open, then  $f(A)$  is  $\tau_{\alpha g}$  closed in  $Y$  if  $A$  is open set in  $X$ .

**Theorem 3.5:** If  $\alpha g(\text{cl}(f(A))) = \text{rcl}(A)$  for every  $A \subset Y$  and  $X$  is discrete space, then the following are equivalent:

- a)  $f: X \rightarrow Y$  is contra  $\alpha g$ -open map
- b)  $\alpha g(\text{cl}(f(A))) \subset f(\text{cl}(A))$

**Proof:** (a)  $\Rightarrow$  (b) follows from theorem 3.3

(b)  $\Rightarrow$  (a) Let  $A$  be any open set in  $X$ , then  $f(A) = f(\text{cl}(A)) \supset \alpha g(\text{cl}(f(A)))$  by hypothesis. We have  $f(A) \subset \alpha g(\text{cl}(f(A)))$ . Combining we get  $f(A) = \alpha g(\text{cl}(f(A))) = \text{rcl}(f(A))$  [ by given condition] which implies  $f(A)$  is  $r$ -closed and hence  $\alpha g$ -closed. Thus  $f$  is contra  $\alpha g$ -open.

**Theorem 3.6:** If  $\alpha(\text{cl}(A)) = \text{rcl}(A)$  for every  $A \subset Y$  and  $X$  is discrete space, then the following are equivalent:

- a)  $f: X \rightarrow Y$  is contra  $\alpha g$ -open map
- b)  $\alpha g(\text{cl}(f(A))) \subset f(\text{cl}(A))$

**Theorem 3.7:**  $f: X \rightarrow Y$  is contra  $\alpha g$ -open iff for each subset  $S$  of  $Y$  and each closed set  $U$  containing  $f^1(S)$ , there is an  $\alpha g$ -open set  $V$  of  $Y$  such that  $S \subseteq V$  and  $f^1(V) \subseteq U$ .

**Proof:** Assume  $f: X \rightarrow Y$  is contra  $\alpha g$ -open. Let  $S \subseteq Y$  and  $U$  be closed set containing  $f^1(S)$ . Then  $X-U$  is open in  $X$  and  $f(X-U)$  is  $\alpha g$ -closed in  $Y$  as  $f$  is contra  $\alpha g$ -open and  $V=Y-f(X-U)$  is  $\alpha g$ -open in  $Y$ .  $f^1(S) \subseteq U \Rightarrow S \subseteq f(U) \Rightarrow S \subseteq V$  and  $f^1(V) = f^1(Y-f(X-U)) = f^1(Y) - f^1(f(X-U)) = f^1(Y) - (X-U) = X - (X-U) = U$

Conversely Let  $F$  be open in  $X \Rightarrow F^c$  is closed. Then  $f^1(f(F^c)) \subseteq F^c$ . By hypothesis there exists an  $\alpha g$ -open set  $V$  of  $Y$ , such that  $f(F^c) \subseteq V$  and  $f^1(V) \supset F^c$  and so  $F \subseteq [f^1(V)]^c$ . Hence  $V^c \subseteq f(F) \subseteq f[f^1(V)]^c \subseteq V^c \Rightarrow f(F) \subseteq V^c \Rightarrow f(F) = V^c$ . Thus  $f(F)$  is  $\alpha g$ -closed in  $Y$ . Therefore  $f$  is contra  $\alpha g$ -open.

**Remark 3:** Composition of two contra  $\alpha g$ -open maps is not contra  $\alpha g$ -open in general

**Theorem 3.8:** Let  $X, Y, Z$  be topological spaces and every  $\alpha g$ -closed set is open in  $Y$ . Then the composition of two contra  $\alpha g$ -open maps is contra  $\alpha g$ -open.

**Proof:**(a) Let  $f$  and  $g$  be contra  $\alpha g$ -open maps. Let  $A$  be any open set in  $X \Rightarrow f(A)$  is open in  $Y$  (by assumption)  $\Rightarrow g(f(A)) = g \circ f(A)$  is  $\alpha g$ -closed in  $Z$ . Therefore  $g \circ f$  is contra  $\alpha g$ -open.

**Corollary 3.5:** Let  $X, Y, Z$  be topological spaces and every  $[r-; \alpha-; r\alpha-]$  closed set is open in  $Y$ . Then the composition of two  $c$ - $[c-r-; c-\alpha-; c-r\alpha-]$  open maps is contra  $\alpha g$ -open.

**Example 3:** Let  $X = Y = Z = \{a, b, c\}$ ;  $\tau = \{\emptyset, \{a\}, \{a, b\}, X\}$ ;  $\sigma = \{\emptyset, \{a, c\}, Y\}$  and  $\eta = \{\emptyset, \{a\}, \{b, c\}, Z\}$ .  $f: X \rightarrow Y$  be defined  $f(a) = c, f(b) = b$  and  $f(c) = a$  and  $g: Y \rightarrow Z$  be defined  $g(a) = b, g(b) = a$  and  $g(c) = c$ , then  $g, f$  and  $g \circ f$  are contra  $\alpha g$ -open.

**Theorem 3.9:** If  $f: X \rightarrow Y$  is contra  $g$ -open [ contra  $rg$ -open],  $g: Y \rightarrow Z$  is  $\alpha g$ -closed and  $Y$  is  $T_{1/2}$  [ $r-T_{1/2}$ ] then  $g \circ f$  is contra  $\alpha g$ -open.

**Proof:**(a) Let  $A$  be open in  $X$ . Then  $f(A)$  is  $g$ -closed and so closed in  $Y$  as  $Y$  is  $T_{1/2} \Rightarrow g(f(A)) = g \circ f(A)$  is  $\alpha g$ -closed in  $Z$  (since  $g$  is  $\alpha g$ -closed). Hence  $g \circ f$  is contra  $\alpha g$ -open.

**Corollary 3.6:** If  $f: X \rightarrow Y$  is contra  $g$ -open [ contra  $rg$ -open],  $g: Y \rightarrow Z$  is  $[r-; \alpha-; r\alpha-]$  closed and  $Y$  is  $T_{1/2}$  [ $r-T_{1/2}$ ] then  $g \circ f$  is contra  $\alpha g$ -open.

**Theorem 3.10:** If  $f: X \rightarrow Y$  is  $g$ -open [  $rg$ -open],  $g: Y \rightarrow Z$  is contra  $\alpha g$ -open and  $Y$  is  $T_{1/2}$  [ $r-T_{1/2}$ ] then  $g \circ f$  is contra  $\alpha g$ -open.

**Proof:**(a) Let  $A$  be open in  $X$ . Then  $f(A)$  is  $g$ -open and so open in  $Y$  as  $Y$  is  $T_{1/2} \Rightarrow g(f(A)) = g \circ f(A)$  is  $\alpha g$ -closed in  $Z$ . Hence  $g \circ f$  is contra  $\alpha g$ -open.

**Theorem 3.11:** If  $f: X \rightarrow Y$  is  $g$ -open [  $rg$ -open],  $g: Y \rightarrow Z$  is  $c$ - $[c-r-; c-\alpha-; c-r\alpha-]$  open and  $Y$  is  $T_{1/2}$  [ $r-T_{1/2}$ ] then  $g \circ f$  is contra  $\alpha g$ -open.

**Theorem 3.12:** If  $f: X \rightarrow Y, g: Y \rightarrow Z$  be two mappings such that  $g \circ f$  is contra  $\alpha g$ -open [ contra open] then the following statements are true.

- If  $f$  is continuous [ $r$ -continuous] and surjective then  $g$  is contra  $\alpha g$ -open.
- If  $f$  is  $g$ -continuous [resp:  $rg$ -continuous], surjective and  $X$  is  $T_{1/2}$  [resp:  $r-T_{1/2}$ ] then  $g$  is contra  $\alpha g$ -open.

**Proof:**  $A$  open in  $Y, f^{-1}(A)$  open in  $X \Rightarrow (g \circ f)(f^{-1}(A)) = g(A)$   $\alpha g$ -closed in  $Z$ . Hence  $g$  is contra  $\alpha g$ -open.

Similarly one can prove the remaining parts and hence omitted.

**Corollary 3.7:** If  $f: X \rightarrow Y, g: Y \rightarrow Z$  be two mappings such that  $g \circ f$  is  $c$ - $[c-r-; c-\alpha-; c-r\alpha-]$  open then the following statements are true.

- If  $f$  is continuous [ $r$ -continuous] and surjective then  $g$  is contra  $\alpha g$ -open.
- If  $f$  is  $g$ -continuous [ $rg$ -continuous], surjective and  $X$  is  $T_{1/2}$  [ $r-T_{1/2}$ ] then  $g$  is contra  $\alpha g$ -open.

**Theorem 3.13:** If  $f: X \rightarrow Y, g: Y \rightarrow Z$  be two mappings such that  $g \circ f$  is  $\alpha g$ -closed then the following statements are true.

- If  $f$  is contra-continuous [contra- $r$ -continuous] and surjective then  $g$  is contra  $\alpha g$ -open.
- If  $f$  is contra- $g$ -continuous [contra- $rg$ -continuous], surjective and  $X$  is  $T_{1/2}$  [resp:  $r-T_{1/2}$ ] then  $g$  is contra  $\alpha g$ -open.

**Proof:**  $A$  open in  $Y, f^{-1}(A)$  closed in  $X \Rightarrow (g \circ f)(f^{-1}(A)) = g(A)$   $\alpha g$ -closed in  $Z$ . Hence  $g$  is contra  $\alpha g$ -open.

**Corollary 3.8:** If  $f: X \rightarrow Y$ ,  $g: Y \rightarrow Z$  be two mappings such that  $gof$  is  $[r-; \alpha-; r\alpha-]$  closed then the following statements are true.

- If  $f$  is contra-continuous [contra- $r$ -continuous] and surjective then  $g$  is contra  $\alpha g$ -open.
- If  $f$  is contra- $g$ -continuous [contra- $rg$ -continuous], surjective and  $X$  is  $T_{1/2}$  [ $r-T_{1/2}$ ] then  $g$  is contra  $\alpha g$ -open.

**Theorem 3.14:** If  $X$  is  $\alpha g$ -regular,  $f: X \rightarrow Y$  is  $r$ -closed, nearly-continuous, contra  $\alpha g$ -open surjection and  $\bar{A} = A$  for every  $\alpha g$ -closed set in  $Y$ , then  $Y$  is  $\alpha g$ -regular.

**Proof:** Let  $p \in U \in \alpha gO(Y)$ . Then there exists a point  $x \in X$  such that  $f(x) = p$  as  $f$  is surjective. Since  $X$  is  $\alpha g$ -regular and  $f$  is  $r$ -continuous there exists  $V \in RO(X)$  such that  $x \in V \subseteq \bar{V} \subseteq f^{-1}(U)$  which implies  $p \in f(V) \subseteq f(\bar{V}) \subseteq f(f^{-1}(U)) = U \rightarrow (1)$

Since  $f$  is contra  $\alpha g$ -open,  $f(\bar{V}) \subseteq U$ , By hypothesis  $\overline{f(\bar{V})} = f(\bar{V})$  and  $\overline{f(\bar{V})} = \overline{f(V)} \rightarrow (2)$

By (1) & (2) we have  $p \in f(V) \subseteq f(\bar{V}) \subseteq U$  and  $f(V)$  is  $\alpha g$ -open. Hence  $Y$  is  $\alpha g$ -regular.

**Corollary 3.9:** If  $X$  is  $\alpha g$ -regular,  $f: X \rightarrow Y$  is  $r$ -closed, nearly-continuous, contra  $\alpha g$ -open surjection and  $\bar{A} = A$  for every  $r$ -closed set in  $Y$  then  $Y$  is  $\alpha g$ -regular.

**Theorem 3.15:** If  $f: X \rightarrow Y$  is contra  $\alpha g$ -open and  $A \in RC(X)$ , then  $f_A: (X, \tau(A)) \rightarrow (Y, \sigma)$  is contra  $\alpha g$ -open.

**Proof:** Let  $F$  be open in  $A$ . Then  $F = A \cap E$  for some open set  $E$  of  $X$  and so  $F$  is open in  $X \Rightarrow f(A)$  is  $\alpha g$ -closed in  $Y$ . But  $f(F) = f_A(F)$ . Therefore  $f_A$  is contra  $\alpha g$ -open.

**Theorem 3.16:** If  $f: X \rightarrow Y$  is contra  $\alpha g$ -open,  $X$  is  $rT_{1/2}$  and  $A$  is  $rg$ -open set of  $X$  then  $f_A: (X, \tau(A)) \rightarrow (Y, \sigma)$  is contra  $\alpha g$ -open.

**Proof:** Let  $F$  be open in  $A$ . Then  $F = A \cap E$  for some open set  $E$  of  $X$  and so  $F$  is open in  $X \Rightarrow f(A)$  is  $\alpha g$ -closed in  $Y$ . But  $f(F) = f_A(F)$ . Therefore  $f_A$  is contra  $\alpha g$ -open.

**Corollary 3.10:** If  $f: X \rightarrow Y$  is  $c$ -[ $c-r$ ;  $c-\alpha$ ;  $c-r\alpha$ ] open and  $A \in RC(X)$ , then  $f_A: (X, \tau(A)) \rightarrow (Y, \sigma)$  is contra  $\alpha g$ -open.

**Theorem 3.17:** If  $f_i: X_i \rightarrow Y_i$  be contra  $\alpha g$ -open for  $i = 1, 2$ . Let  $f: X_1 \times X_2 \rightarrow Y_1 \times Y_2$  be defined as  $f(x_1, x_2) = (f_1(x_1), f_2(x_2))$ . Then  $f: X_1 \times X_2 \rightarrow Y_1 \times Y_2$  is contra  $\alpha g$ -open.

**Proof:** Let  $U_1 \times U_2 \subseteq X_1 \times X_2$  where  $U_i$  is open in  $X_i$  for  $i = 1, 2$ . Then  $f(U_1 \times U_2) = f_1(U_1) \times f_2(U_2)$  is  $\alpha g$ -closed set in  $Y_1 \times Y_2$ . Hence  $f$  is contra  $\alpha g$ -open.

**Corollary 3.11:** If  $f_i: X_i \rightarrow Y_i$  be  $c$ -[ $c-r$ ;  $c-\alpha$ ;  $c-r\alpha$ ] open for  $i = 1, 2$ . Let  $f: X_1 \times X_2 \rightarrow Y_1 \times Y_2$  be defined as  $f(x_1, x_2) = (f_1(x_1), f_2(x_2))$ , then  $f: X_1 \times X_2 \rightarrow Y_1 \times Y_2$  is contra  $\alpha g$ -open.

#### §4. ALMOST CONTRA $\alpha g$ -OPEN MAPPINGS:

**Definition 4.1:** A function  $f: X \rightarrow Y$  is said to be almost contra  $\alpha g$ -open if the image of every  $r$ -open set in  $X$  is  $\alpha g$ -closed in  $Y$ .

**Theorem 4.1:** Every contra  $\alpha g$ -open map is almost contra  $\alpha g$ -open map but not conversely.

**Theorem 4.2:** We have the following interrelation among the following almost contra open mappings

(ii)  $c.r\alpha.open \xrightarrow{\uparrow} c.r.open \rightarrow c.open \rightarrow c.\alpha.open \rightarrow al.c.\alpha.g.open$   $c.g.open \xrightarrow{\downarrow} al.c.\alpha.g.open$  None is reversible

(iii) If  $\alpha GC(Y) = RC(Y)$ , then the reverse relations hold for all almost contra open maps.

$al.c.r\alpha.open \xleftrightarrow{\uparrow\downarrow} al.c.r.open \leftrightarrow al.c.open \leftrightarrow al.c.\alpha.open \leftrightarrow al.c.\alpha.g.open$   
 $al.c.g.open \xleftrightarrow{\uparrow\downarrow} al.c.\alpha.g.open$

**Example 4:** Let  $X = Y = \{a, b, c\}$ ;  $\tau = \{\emptyset, \{a\}, \{b, c\}, X\} = \sigma$ . Let  $f: X \rightarrow Y$  be defined  $f(a) = c, f(b) = a$  and  $f(c) = b$ . Then  $f$  is almost contra  $\alpha g$ -open.

**Example 5:** Let  $X = Y = \{a, b, c\}$ ;  $\tau = \{\emptyset, \{a\}, \{b, c\}, X\}$ ;  $\sigma = \{\emptyset, \{a\}, \{b\}, \{a, b\}, Y\}$ . Let  $f: X \rightarrow Y$  be defined  $f(a) = c, f(b) = a$  and  $f(c) = b$ . Then  $f$  is not almost contra  $\alpha g$ -open, almost contra open, almost contra  $\alpha$ -open, almost contra  $r\alpha$ -open and almost contra  $g$ -open.

#### Theorem 4.3:

- (i) If  $(Y, \sigma)$  is discrete, then  $f$  is almost contra open of all types.
- (ii) If  $f$  is almost contra open and  $g$  is  $\alpha g$ -closed then  $gof$  is almost contra  $\alpha g$ -open.
- (iii) If  $f$  is almost open and  $g$  is contra  $\alpha g$ -open then  $gof$  is almost contra  $\alpha g$ -open.

**Corollary 4.1:** If  $f$  is almost contra open and  $g$  is  $[r-; \alpha-; r\alpha-]$  closed then  $gof$  is almost contra  $\alpha g$ -open.

**Corollary 4.2:** If  $f$  is almost open[almost  $r$ -closed] and  $g$  is  $c-[c-r-; c-\alpha-; c-r\alpha-]$  open then  $gof$  is almost contra  $\alpha g$ -open.

**Theorem 4.4:** If  $f: X \rightarrow Y$  is almost contra  $\alpha g$ -open, then  $\alpha g(\text{cl}(f(A))) \subset f(\text{cl}(A))$

**Proof:** Let  $A \subset X$  be  $r$ -open and  $f: X \rightarrow Y$  is almost contra  $\alpha g$ -open gives  $f(\text{cl}\{A\})$  is  $\alpha g$ -closed in  $Y$  and  $f(A) \subset f(\text{cl}(A))$  which in turn gives  $\alpha g(\text{cl}(f(A))) \subset \alpha g(\text{cl}(f(\text{cl}(A))))$ ----- (1)

Since  $f(\text{cl}(A))$  is  $\alpha g$ -closed in  $Y$ ,  $\alpha g(\text{cl}(f(\text{cl}(A)))) = f(\text{cl}(A))$ ----- (2)

From (1) and (2) we have  $\alpha g(\text{cl}(f(A))) \subset f(\text{cl}(A))$  for every subset  $A$  of  $X$ .

**Remark 4:** Converse is not true in general.

**Corollary 4.3:** If  $f: X \rightarrow Y$  is  $al-c-[al-c-r-; al-c-\alpha-; al-c-r\alpha-]$  open, then  $\alpha g(\text{cl}(f(A))) \subset f(\text{cl}(A))$

**Theorem 4.5:** If  $f: X \rightarrow Y$  is almost contra  $\alpha g$ -open and  $A \subseteq X$  is  $r$ -open,  $f(A)$  is  $\tau_{\alpha g}$ -closed in  $Y$ .

**Proof:** Let  $A \subset X$  be  $r$ -open and  $f: X \rightarrow Y$  is almost contra  $\alpha g$ -open implies  $\alpha g(\text{cl}(f(A))) \subset f(\text{cl}(A))$  which in turn implies  $\alpha g(\text{cl}(f(A))) \subset f(A)$ , since  $f(A) = f(\text{cl}(A))$ . But  $f(A) \subset \alpha g(\text{cl}(f(A)))$ . Combining we get  $f(A) = \alpha g(\text{cl}(f(A)))$ . Hence  $f(A)$  is  $\tau_{\alpha g}$ -closed in  $Y$ .

**Corollary 4.4:** If  $f: X \rightarrow Y$  is  $al-c-[al-c-r-; al-c-\alpha-; al-c-r\alpha-]$  open, then  $f(A)$  is  $\tau_{\alpha g}$  closed in  $Y$  if  $A$  is  $r$ -open set in  $X$ .

**Theorem 4.6:** If  $f: X \rightarrow Y$  is  $c-[c-r-; c-\alpha-; c-r\alpha-]$  open and  $A \subseteq X$  is  $r$ -open,  $f(A)$  is  $\tau_{\alpha g}$ -closed in  $Y$ .

**Proof:** For  $A \subset X$  is  $r$ -open and  $f: X \rightarrow Y$  is  $c-r$ -open,  $f(A)$  is  $\tau_r$ -closed in  $Y$  and so  $f(A)$  is  $\tau_{\alpha g}$ -closed in  $Y$ . [since  $r$ -closed set is  $\alpha g$ -closed]. Similarly we can prove the remaining results.

**Theorem 4.7:** If  $\alpha g(\text{cl}(f(A))) = \text{rcl}(A)$  for every  $A \subseteq Y$  and  $X$  is discrete space, then the following are equivalent:

- a)  $f: X \rightarrow Y$  is almost contra  $\alpha g$ -open map
- b)  $\alpha g(\text{cl}(f(A))) \subseteq f(\text{cl}(A))$

**Proof:** (a)  $\Rightarrow$  (b) follows from theorem 4.4

(b)  $\Rightarrow$  (a) Let  $A$  be any  $r$ -open set in  $X$ , then  $f(A) = f(\text{cl}(A)) \supseteq \alpha g(\text{cl}(f(A)))$  by hypothesis. We have  $f(A) \subseteq \alpha g(\text{cl}(f(A)))$ . Combining we get  $f(A) = \alpha g(\text{cl}(f(A))) = \text{rcl}(f(A))$  [by given condition] which implies  $f(A)$  is  $r$ -closed and hence  $\alpha g$ -closed. Thus  $f$  is almost contra  $\alpha g$ -open.

**Theorem 4.8:** If  $\alpha(\text{cl}(A)) = \text{rcl}(A)$  for every  $A \subseteq Y$  and  $X$  is discrete space, then the following are equivalent:

- a)  $f: X \rightarrow Y$  is almost contra  $\alpha g$ -open map
- b)  $\alpha g(\text{cl}(f(A))) \subseteq f(\text{cl}(A))$

**Proof:** (a)  $\Rightarrow$  (b) follows from theorem 4.4

(b)  $\Rightarrow$  (a) Let  $A$  be any  $r$ -open set in  $X$ , then  $f(A) = f(\text{cl}(A)) \supseteq \alpha g(\text{cl}(f(A)))$  by hypothesis. We have  $f(A) \subseteq \alpha g(\text{cl}(f(A)))$ . Combining we get  $f(A) = \alpha g(\text{cl}(f(A))) = \text{rcl}(f(A))$  [by given condition] which implies  $f(A)$  is  $r$ -closed and hence  $\alpha g$ -closed. Thus  $f$  is almost contra  $\alpha g$ -open.

**Theorem 4.9:**  $f: X \rightarrow Y$  is almost contra  $\alpha g$ -open iff for each subset  $S$  of  $Y$  and each  $U \in \text{RC}(X, f^{-1}(S))$ , there is an  $\alpha g$ -open set  $V$  of  $Y$  such that  $S \subseteq V$  and  $f^{-1}(V) \subseteq U$ .

**Proof:** Assume  $f: X \rightarrow Y$  is almost contra  $\alpha g$ -open. Let  $S \subseteq Y$  and  $U \in \text{RC}(X, f^{-1}(S))$ . Then  $X - U$  is  $r$ -open in  $X$  and  $f(X - U)$  is  $\alpha g$ -closed in  $Y$  as  $f$  is almost contra  $\alpha g$ -open and  $V = Y - f(X - U)$  is  $\alpha g$ -open in  $Y$ .  $f^{-1}(S) \subseteq U \Rightarrow S \subseteq f(U) \Rightarrow S \subseteq V$  and  $f^{-1}(V) = f^{-1}(Y - f(X - U)) = f^{-1}(Y) - f^{-1}(f(X - U)) = f^{-1}(Y) - (X - U) = X - (X - U) = U$

Conversely Let  $F$  be  $r$ -open in  $X \Rightarrow F^c$  is  $r$ -closed. Then  $f^{-1}(f(F^c)) \subseteq F^c$ . By hypothesis there exists an  $\alpha g$ -open set  $V$  of  $Y$ , such that  $f(F^c) \subseteq V$  and  $f^{-1}(V) \supseteq F^c$  and so  $F \subseteq [f^{-1}(V)]^c$ . Hence  $V^c \subseteq f(F) \subseteq f[f^{-1}(V)^c] \subseteq V^c \Rightarrow f(F) \subseteq V^c \Rightarrow f(F) = V^c$ . Thus  $f(F)$  is  $\alpha g$ -closed in  $Y$ . Thus  $f$  is almost contra  $\alpha g$ -open.

**Remark 5:** Composition of two almost contra  $\alpha g$ -open maps is not almost contra  $\alpha g$ -open in general.

**Theorem 4.10:** Let  $X, Y, Z$  be topological spaces and every  $\alpha g$ -closed set is  $r$ -open in  $Y$ . Then the composition of two almost contra  $\alpha g$ -open maps is almost contra  $\alpha g$ -open.

**Proof:** (a) Let  $f$  and  $g$  be almost contra  $\alpha g$ -open maps. Let  $A$  be any  $r$ -open set in  $X \Rightarrow f(A)$  is  $r$ -open in  $Y$  (by assumption)  $\Rightarrow g(f(A)) = g \circ f(A)$  is  $\alpha g$ -closed in  $Z$ . Therefore  $g \circ f$  is almost contra  $\alpha g$ -open.

**Theorem 4.11:** Let  $X, Y, Z$  be topological spaces and every  $[r-; \alpha-; r\alpha-]$ closed set is  $r$ -open in  $Y$ . Then the composition of two al-c-[al-c-r-; al-c- $\alpha$ -; al-c-r $\alpha$ -]open maps is almost contra  $\alpha g$ -open.

**Proof:** Let  $A$  be  $r$ -open set in  $X$ , then  $f(A)$  is  $r$ -closed in  $Y$  and so  $r$ -open in  $Y$  (by assumption)  $\Rightarrow g(f(A)) = g \circ f(A)$  is  $r$ -closed in  $Z$ . Hence  $g \circ f$  is almost contra  $\alpha g$ -open.

**Corollary 4.5:** Let  $X, Y, Z$  be topological spaces and every  $[r-; \alpha-; r\alpha-]$ closed set is open [ $r$ -open] in  $Y$ . Then the composition of two c-[c-r-; c- $\alpha$ -; c-r $\alpha$ -]open maps is almost contra  $\alpha g$ -open.

**Example 6:** Let  $X = Y = Z = \{a, b, c\}$ ;  $\tau = \{\emptyset, \{a\}, \{a, b\}, X\}$ ;  $\sigma = \{\emptyset, \{a, c\}, Y\}$  and  $\eta = \{\emptyset, \{a\}, \{b, c\}, Z\}$ .  $f: X \rightarrow Y$  be defined  $f(a) = c, f(b) = b$  and  $f(c) = a$  and  $g: Y \rightarrow Z$  be defined  $g(a) = b, g(b) = a$  and  $g(c) = c$ , then  $g, f$  and  $g \circ f$  are almost contra  $\alpha g$ -open.

**Theorem 4.12:** If  $f:X \rightarrow Y$  is almost contra  $g$ -open[almost contra  $rg$ -open],  $g:Y \rightarrow Z$  is  $\alpha g$ -closed and  $Y$  is  $T_{1/2}$  [ $r$ - $T_{1/2}$ ] then  $gof$  is almost contra  $\alpha g$ -open.

**Proof:** (a) Let  $A$  be  $r$ -open in  $X$ . Then  $f(A)$  is  $g$ -closed and so closed in  $Y$  as  $Y$  is  $T_{1/2} \Rightarrow g(f(A)) = gof(A)$  is  $\alpha g$ -closed in  $Z$  (since  $g$  is  $\alpha g$ -closed). Hence  $gof$  is almost contra  $\alpha g$ -open.

**Corollary 4.6:** If  $f:X \rightarrow Y$  is almost contra  $g$ -open[almost contra  $rg$ -open],  $g:Y \rightarrow Z$  is [ $r$ -;  $\alpha$ -;  $r\alpha$ -]closed and  $Y$  is  $T_{1/2}$  [ $r$ - $T_{1/2}$ ] then  $gof$  is almost contra  $\alpha g$ -open.

**Theorem 4.13:** If  $f:X \rightarrow Y$  is almost  $g$ -open[almost  $rg$ -open],  $g:Y \rightarrow Z$  is contra  $\alpha g$ -open and  $Y$  is  $T_{1/2}$  [ $r$ - $T_{1/2}$ ] then  $gof$  is almost contra  $\alpha g$ -open.

**Proof:** (a) Let  $A$  be  $r$ -open in  $X$ . Then  $f(A)$  is  $g$ -open and so open in  $Y$  as  $Y$  is  $T_{1/2} \Rightarrow g(f(A)) = gof(A)$  is  $\alpha g$ -closed in  $Z$  (since  $g$  is contra  $\alpha g$ -open). Hence  $gof$  is almost contra  $\alpha g$ -open.

**Theorem 4.14:** If  $f:X \rightarrow Y$  is almost  $g$ -open[almost  $rg$ -open],  $g:Y \rightarrow Z$  is  $c$ -[ $c$ - $r$ -;  $c$ - $\alpha$ -;  $c$ - $r\alpha$ -]open and  $Y$  is  $T_{1/2}$  [ $r$ - $T_{1/2}$ ] then  $gof$  is almost contra  $\alpha g$ -open.

**Theorem 4.15:** If  $f:X \rightarrow Y$  is  $g$ -open[ $rg$ -open],  $g:Y \rightarrow Z$  is  $c$ -[ $c$ - $r$ -;  $c$ - $\alpha$ -;  $c$ - $r\alpha$ -]open and  $Y$  is  $T_{1/2}$  [ $r$ - $T_{1/2}$ ], then  $gof$  is almost contra  $\alpha g$ -open.

**Proof:** Let  $A$  be  $r$ -open set in  $X$ , then  $f(A)$  is  $g$ -closed in  $Y$  and so closed in  $Y$  (by assumption)  $\Rightarrow g(f(A)) = gof(A)$  is  $r$ -closed in  $Z$ . Hence  $gof$  is almost contra  $\alpha g$ -open.

**Theorem 4.16:** If  $f:X \rightarrow Y$  is  $c$ - $g$ -open[ $c$ - $rg$ -open],  $g:Y \rightarrow Z$  is [ $r$ -;  $\alpha$ -;  $r\alpha$ -]closed and  $Y$  is  $T_{1/2}$  [ $r$ - $T_{1/2}$ ], then  $gof$  is almost contra  $\alpha g$ -open.

**Proof:** Let  $A$  be  $r$ -open set in  $X$ , then  $f(A)$  is  $g$ -closed in  $Y$  and so closed in  $Y$  (by assumption)  $\Rightarrow g(f(A)) = gof(A)$  is  $r$ -closed in  $Z$ . Hence  $gof$  is almost contra  $\alpha g$ -open.

**Theorem 4.17:** If  $f:X \rightarrow Y$ ,  $g:Y \rightarrow Z$  be two mappings such that  $gof$  is contra  $\alpha g$ -open then the following statements are true.

- If  $f$  is continuous [ $r$ -continuous] and surjective then  $g$  is almost contra  $\alpha g$ -open.
- If  $f$  is  $g$ -continuous[resp:  $rg$ -continuous], surjective and  $X$  is  $T_{1/2}$  [resp:  $r$ - $T_{1/2}$ ] then  $g$  is almost contra  $\alpha g$ -open.

**Proof:** (a) For  $A$   $r$ -open in  $Y$ ,  $f^{-1}(A)$  open in  $X \Rightarrow (g \circ f)(f^{-1}(A)) = g(A)$   $\alpha g$ -closed in  $Z$ . Hence  $g$  is almost contra  $\alpha g$ -open.

Similarly one can prove the remaining parts and hence omitted.

**Corollary 4.7:** If  $f:X \rightarrow Y$ ,  $g:Y \rightarrow Z$  be two mappings such that  $gof$  is contra  $\alpha g$ -open then the following statements are true.

- If  $f$  is almost continuous [almost  $r$ -continuous] and surjective then  $g$  is almost contra  $\alpha g$ -open.
- If  $f$  is almost  $g$ -continuous[resp: almost  $rg$ -continuous], surjective and  $X$  is  $T_{1/2}$  [resp:  $r$ - $T_{1/2}$ ] then  $g$  is almost contra  $\alpha g$ -open.

**Corollary 4.8:** If  $f:X \rightarrow Y$ ,  $g:Y \rightarrow Z$  be two mappings such that  $gof$  is  $c$ -[ $c$ - $r$ -;  $c$ - $\alpha$ -;  $c$ - $r\alpha$ -]open then the following statements are true.

- If  $f$  is continuous [ $r$ -continuous] and surjective then  $g$  is almost contra  $\alpha g$ -open.
- If  $f$  is  $g$ -continuous[ $rg$ -continuous], surjective and  $X$  is  $T_{1/2}$  [ $r$ - $T_{1/2}$ ] then  $g$  is almost contra  $\alpha g$ -open.

**Corollary 4.9:** If  $f:X \rightarrow Y$ ,  $g:Y \rightarrow Z$  be two mappings such that  $gof$  is  $c$ -[ $c$ - $r$ -;  $c$ - $\alpha$ -;  $c$ - $r\alpha$ -]open then the following statements are true.

- a) If  $f$  is almost continuous [almost  $r$ -continuous] and surjective then  $g$  is almost contra  $\alpha g$ -open.  
b) If  $f$  is almost  $g$ -continuous [almost  $rg$ -continuous], surjective and  $X$  is  $T_{1/2}$  [ $r$ - $T_{1/2}$ ] then  $g$  is almost contra  $\alpha g$ -open.

**Theorem 4.18:** If  $f: X \rightarrow Y$ ,  $g: Y \rightarrow Z$  be two mappings such that  $gof$  is  $\alpha g$ -closed [ $r$ -closed] then the following statements are true.

- a) If  $f$  is contra-continuous [contra- $r$ -continuous] and surjective then  $g$  is almost contra  $\alpha g$ -open.  
b) If  $f$  is contra- $g$ -continuous [contra- $rg$ -continuous], surjective and  $X$  is  $T_{1/2}$  [resp:  $r$ - $T_{1/2}$ ] then  $g$  is almost contra  $\alpha g$ -open.

**Proof:** (a) For  $A$   $r$ -open in  $Y$ ,  $f^{-1}(A)$  closed in  $X \Rightarrow (g \circ f)(f^{-1}(A)) = g(A)$   $\alpha g$ -closed in  $Z$ . Hence  $g$  is almost contra  $\alpha g$ -open.

**Corollary 4.10:** If  $f: X \rightarrow Y$ ,  $g: Y \rightarrow Z$  be two mappings such that  $gof$  is  $\alpha g$ -closed [ $r$ -closed] then the following statements are true.

- a) If  $f$  is almost contra-continuous [almost contra- $r$ -continuous] and surjective then  $g$  is almost contra  $\alpha g$ -open.  
b) If  $f$  is almost contra- $g$ -continuous [almost contra- $rg$ -continuous], surjective and  $X$  is  $T_{1/2}$  [resp:  $r$ - $T_{1/2}$ ] then  $g$  is almost contra  $\alpha g$ -open.

**Corollary 4.11:** If  $f: X \rightarrow Y$ ,  $g: Y \rightarrow Z$  be two mappings such that  $gof$  is [ $r$ -,  $\alpha$ -,  $r\alpha$ -]closed then the following statements are true.

- a) If  $f$  is contra-continuous [contra- $r$ -continuous] and surjective then  $g$  is almost contra  $\alpha g$ -open.  
b) If  $f$  is contra- $g$ -continuous [contra- $rg$ -continuous], surjective and  $X$  is  $T_{1/2}$  [ $r$ - $T_{1/2}$ ] then  $g$  is almost contra  $\alpha g$ -open.

**Corollary 4.12:** If  $f: X \rightarrow Y$ ,  $g: Y \rightarrow Z$  be two mappings such that  $gof$  is [ $r$ -,  $\alpha$ -,  $r\alpha$ -]closed then the following statements are true.

- a) If  $f$  is almost contra-continuous [almost contra- $r$ -continuous] and surjective then  $g$  is almost contra  $\alpha g$ -open.  
b) If  $f$  is almost contra- $g$ -continuous [almost contra- $rg$ -continuous], surjective and  $X$  is  $T_{1/2}$  [ $r$ - $T_{1/2}$ ] then  $g$  is almost contra  $\alpha g$ -open.

**Theorem 4.19:** If  $X$  is  $\alpha g$ -regular,  $f: X \rightarrow Y$  is  $r$ -closed, nearly-continuous, almost contra  $\alpha g$ -open surjection and  $\bar{A} = A$  for every  $\alpha g$ -closed set in  $Y$ , then  $Y$  is  $\alpha g$ -regular.

**Proof:** Let  $p \in U \in \alpha gO(Y)$ . Then there exists a point  $x \in X$  such that  $f(x) = p$  as  $f$  is surjective. Since  $X$  is  $\alpha g$ -regular and  $f$  is  $r$ -continuous there exists  $V \in RO(X)$  such that  $x \in V \subseteq \bar{V} \subseteq f^{-1}(U)$  which implies  $p \in f(V) \subseteq f(\bar{V}) \subseteq f(f^{-1}(U)) = U \rightarrow (1)$

Since  $f$  is almost contra  $\alpha g$ -open,  $f(\bar{V}) \subseteq U$ . By hypothesis  $\overline{f(\bar{V})} = f(\bar{V})$  and  $\overline{f(\bar{V})} = \overline{f(V)} \rightarrow (2)$

By (1) & (2) we have  $p \in f(V) \subseteq f(\bar{V}) \subseteq U$  and  $f(V)$  is  $\alpha g$ -open. Hence  $Y$  is  $\alpha g$ -regular.

**Corollary 4.13:** If  $X$  is  $\alpha g$ -regular,  $f: X \rightarrow Y$  is  $r$ -closed, nearly-continuous, almost contra  $\alpha g$ -open surjection and  $\bar{A} = A$  for every  $r$ -closed set in  $Y$  then  $Y$  is  $\alpha g$ -regular.

**Theorem 4.20:** If  $f: X \rightarrow Y$  is almost contra  $\alpha g$ -open and  $A \in RO(X)$ , then  $f_A: (X, \tau(A)) \rightarrow (Y, \sigma)$  is almost contra  $\alpha g$ -open.

**Proof:** Let  $F$  be an  $r$ -open set in  $A$ . Then  $F = A \cap E$  for some  $r$ -open set  $E$  of  $X$  and so  $F$  is  $r$ -open in  $X \Rightarrow f(A)$  is  $\alpha g$ -closed in  $Y$ . But  $f(F) = f_A(F)$ . Therefore  $f_A$  is almost contra  $\alpha g$ -open.

**Theorem 4.21:** If  $f: X \rightarrow Y$  is almost contra  $\alpha g$ -open,  $X$  is  $rT_{1/2}$  and  $A$  is  $rg$ -open set of  $X$  then  $f_A: (X, \tau(A)) \rightarrow (Y, \sigma)$  is almost contra  $\alpha g$ -open.

**Proof:** Let  $F$  be a  $r$ -open set in  $A$ . Then  $F = A \cap E$  for some  $r$ -open set  $E$  of  $X$  and so  $F$  is  $r$ -open in  $X \Rightarrow f(A)$  is  $\alpha g$ -closed in  $Y$ . But  $f(F) = f_A(F)$ . Therefore  $f_A$  is almost contra  $\alpha g$ -open.

**Corollary 4.14:** If  $f: X \rightarrow Y$  is  $c$ - $[c-r-; c-\alpha-; c-r\alpha-]$  open and  $A \in RO(X)$ , then  $f_A: (X, \tau(A)) \rightarrow (Y, \sigma)$  is almost contra  $\alpha g$ -open.

**Corollary 4.15:** If  $f: X \rightarrow Y$  is  $al$ - $c$ - $[al-c-r-; al-c-\alpha-; al-c-r\alpha-]$  open and  $A \in RO(X)$ , then  $f_A: (X, \tau(A)) \rightarrow (Y, \sigma)$  is almost contra  $\alpha g$ -open.

**Theorem 4.22:** If  $f_i: X_i \rightarrow Y_i$  be almost contra  $\alpha g$ -open for  $i = 1, 2$ . Let  $f: X_1 \times X_2 \rightarrow Y_1 \times Y_2$  be defined as  $f(x_1, x_2) = (f_1(x_1), f_2(x_2))$ . Then  $f: X_1 \times X_2 \rightarrow Y_1 \times Y_2$  is almost contra  $\alpha g$ -open.

**Proof:** Let  $U_1 \times U_2 \subseteq X_1 \times X_2$  where  $U_i$  is  $r$ -open in  $X_i$  for  $i = 1, 2$ . Then  $f(U_1 \times U_2) = f_1(U_1) \times f_2(U_2)$  is  $\alpha g$ -closed set in  $Y_1 \times Y_2$ . Hence  $f$  is almost contra  $\alpha g$ -open.

**Corollary 4.16:** If  $f_i: X_i \rightarrow Y_i$  be  $al$ - $c$ - $[al-c-r-; al-c-\alpha-; al-c-r\alpha-]$  open for  $i = 1, 2$ .

Let  $f: X_1 \times X_2 \rightarrow Y_1 \times Y_2$  be defined as  $f(x_1, x_2) = (f_1(x_1), f_2(x_2))$ , then  $f: X_1 \times X_2 \rightarrow Y_1 \times Y_2$  is almost contra  $\alpha g$ -open.

**Corollary 4.17:** If  $f_i: X_i \rightarrow Y_i$  be  $c$ - $[c-r-; c-\alpha-; c-r\alpha-]$  open for  $i = 1, 2$ . Let  $f: X_1 \times X_2 \rightarrow Y_1 \times Y_2$  be defined as  $f(x_1, x_2) = (f_1(x_1), f_2(x_2))$ , then  $f: X_1 \times X_2 \rightarrow Y_1 \times Y_2$  is almost contra  $\alpha g$ -open.

## CONCLUSION:

In this paper the authors introduced the concepts of contra  $\alpha g$ -open mappings, almost contra  $\alpha g$ -open mappings, studied their basic properties and interrelationship between other such contra open maps.

**Acknowledgement:** The Authors would like to thank the referees for their critical comments, suggestions and corrections towards the development of the paper.
